

After Sandy

All of us at Jersey Infrared Consultants thank everyone for their thoughts and well wishes following Hurricane Sandy. Our staff made it through the storm with varying degrees of difficulty, the most common of which was a lack of electrical and communications utilities.

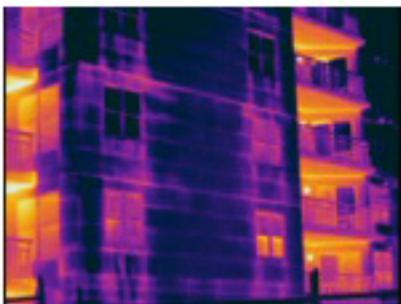

During the past several days we have been busy helping our clients and friends get back on their feet by providing infrared inspections for damage assessment as well as related disaster recovery services.

If you or your clients suffered damage from the storm, we can provide services that are essential for getting equipment and facilities back to normal. With nearly 30 years in business, Jersey Infrared Consultants have the equipment and expertise to locate and document the extent of storm damage.

We are available 24/7 and look forward to working with you during the recovery process.

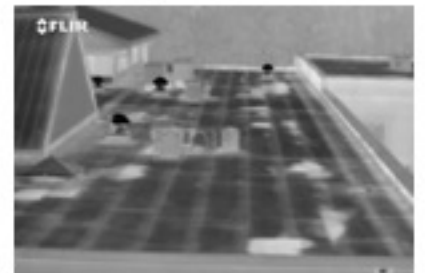

Infrared Inspections for Damage Assessment

Infrared thermography is a powerful tool for documenting damage associated with Hurricane Sandy.

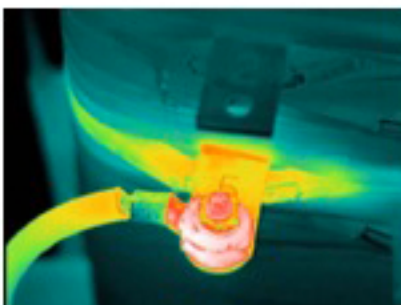

An Infrared Survey conducted by Jersey Infrared Consultants can find water damage within a wide variety of structures and systems. Infrared Surveys can also provide documentation necessary for insurance claims. Common applications and benefits include the following:

- Flat Roofs - detect wet insulation due to storm damage
- Building Interiors - document extent of moisture damage in carpets, drywall and ceiling tiles
- Building Sidewalls - determine extent of latent moisture

Our written reports provide the documentation needed for insurance claims and for directing repair crews to areas needing attention. Inspections are nondestructive and can often be performed with little or no advance preparation.

Electrical Testing & Repair Services

If your property has been flooded, it is imperative that your electrical system be properly tested before power is restored. Jersey Infrared Consultants provide a full range of electrical testing services to help ensure the safety and performance of your electrical system and its components.

We provide testing, maintenance, and repair services for:

- Substations and Transformers
- Motors and Generators
- Cables and Switchgear
- Circuit Breakers and Switches

We can also provide cleanup services for facilities of all sizes. All work is performed by experienced high voltage specialists certified by the InterNational Electrical Testing Association in accordance with NFPA and NETA standards and specifications.

Infrared Surveys for Commissioning

Once your facility is up and running, Jersey Infrared Consultants can provide infrared inspections of new installations, repairs, or retrofits. Our Infrared Surveys can help to show that equipment and structures are operating properly and free of workmanship or equipment defects. The result is fewer failures, improved reliability, and peace of mind.

Typical applications include:

- Electrical Systems
- Mechanical Systems
- Roofing Systems
- HVAC Systems

All Infrared Surveys are conducted by Level III Infrasppection Institute Certified Infrared Thermographers in accordance with current industry practices and published standards.
